

All About

Advantages:

- ✓ Fast Acting!
- ✓ No Brushing!
- ✓ Dissolves Immediately!
- ✓ No Copper or Silver!
- ✓ Safe in any gunite, vinyl, plaster or fiberglass pool!
- ✓ Guaranteed! U.S. Patent #4,614,595

Results:

YELLOW OUT produces amazing results!

- Quickly
- Economically

Questions:

*After adding **YELLOW OUT** and chlorine, my pool changed from cloudy green to milky blue. How can I clear it up?*

You have a filtration problem. Most likely you have a sand filter. The algae that were present before you added the chemicals have been killed; however, because of their size, they passed through your filter without being trapped. We recommend that you add a filter aid that coats the top of the sand and traps this residue. Cartridge filters sometimes require a water clarifier to increase the effectiveness of the filter. Normally, this particulate will be trapped by the DE filter.

*How soon after application of **YELLOW OUT** can I swim?*

YELLOW OUT dissolves immediately. After the chlorine has dissolved completely, when the pool is clear and visibility is good, you may swim at your discretion.

*How long should I run my filter after adding **YELLOW OUT**?*

At least the first 24 hours, run your filter continuously. Shut off the skimmers and open the main drain so that the water is being pulled from the bottom of the pool. Because of varying amounts of particulate and the quality of circulation and filtration, you may find it necessary to run your system longer and to add a water clarifier. The type of filter will make a difference as to how fast the pool clears. If you backwash a sand filter too often, the sand will not act as a very fine filter for smaller particulate. Therefore, if you have

Unique Safety:

YELLOW OUT is not an algicide, herbicide or pesticide. It does not contain quarternaries (foam), copper (stain), silver or poison. No algicide can match the safety of **YELLOW OUT**.

When was the last time you read the precautionary statements on algicide such as "This pesticide toxic to fish," "May require permits for discharge," etc.?

YELLOW OUT doesn't require such statements. WHY NOT? Because, alone, **YELLOW OUT** will not kill algae. However, when **YELLOW OUT** is used with chlorine, cleanup is achieved quickly and economically.

recently backwashed your sand system, there is no need to backwash again before the application of **YELLOW OUT**. It's normally recommended that you do not backwash until you have at least a 10 lb. pressure increase over your normal reading for a clean filter.

*What is the active ingredient in **YELLOW OUT**?*

YELLOW OUT is not an algicide; it is strictly a pool cleaner. When added to the pool without chlorine, nothing happens. Therefore, it is not required to list ingredients on the container.

What is your guarantee?

If you follow the instructions and the product doesn't perform, go to your dealer, explain what happened and you will be advised. Also, feel free to call our 800 number listed on the other side of this sheet for additional assistance.

This product is guaranteed to perform when the simple instructions are followed. However, neither Coral Seas nor the seller makes any guarantee, expressed or implied, concerning this product when used in a manner inconsistent with its labeling. Neither shall be held responsible for any personal injury, property damages or other types of loss resulting from mishandling, improper storage or improper use of this material.
